

What is Bolivia's energy mix?

Bolivia's overall energy mix is dominated by fossil fuels, with natural gas (50%) and petroleum products (31%) supplying most of the country's energy in 2020. In 2021, Bolivia's national electricity agency ENDE announced its intention to generate up to 80% of the country's power from renewable sources by 2025.

What type of energy system does Bolivia use?

Similar to the country's total energy system, the power sector relies heavily on natural gas (AETN, 2016). The electricity network in Bolivia is broken into two classifications: the National Interconnected System (SIN) and the Isolated Systems (SAs).

How can Bolivia improve energy production?

Bolivia continues to make efforts to upgrade the infrastructure needed for renewable energy production. The National Interconnected System (SIN), which the government has put in place, aims to improve the nation's capacity for producing electricity by building additional power plants, transmission lines and substations.

Will Bolivia expand its electric grid through 2025?

Bolivia plans to invest billions towards expanding its electric grid through 2025. This energy plan would bring electricity to more rural areas and generate more electricity to meet domestic demand and increase export capacity.

How much power will Bolivia have by 2025?

More recently, Bolivia's national electricity company (ENDE) projected that by 2025, 74% of the installed capacity will be from hydropower, 4% from non-hydro renewables energy, 12% from combined cycle plants, and 10% from thermal power plants (ENDE, 2016). These projections, though, only take into consideration the SIN.

Which companies make electricity in Bolivia?

These companies fall under ENDE (the National Electricity Company). Bolivia's electricity production is based on thermoelectricity (71 percent), hydroelectricity (20 percent), and solar and wind (9 percent). The best sales prospects are with hydrocarbons: natural gas-related machinery, equipment, and production.
