What should be considered in supercapacitors-based energy storage subsystem?

Furthermore, supercapacitors-based energy storage subsystem should consider the nonlinearity of supercapacitors such as leakage, residual energy, topology, energy density, and charge redistribution to charge the supercapacitors efficiently.

The energy in the supercapacitor is stored in physically separated negative and positive charges. The supercapacitor acts as a buffer when used with a battery. In this way, it protects the battery from high power drain. Supercapacitors have unlimited life cycles, high power density, fast charging time and less equivalent series resistance.

Nevertheless, regular supercapacitors can only achieve energy storage without harvesting energy and the energy density is still not very high compared to batteries. Therefore, combining high specific energy and high
