

How does the grid development process work in Switzerland?

The grid development process in Switzerland is governed by the provisions of the Federal Act on the Renovation and Expansion of the Grids (Electricity Grid Strategy). The relevant provisions are found in particular in the Electricity Supply Act (Article 9a-d StromVG).

Why is the Swiss transmission grid important?

The Swiss transmission grid, which is like a network of electricity highways, has an important role to play. As the backbone of a secure supply of electricity, it makes a key contribution to achieving the goals of the Energy Strategy 2050. Switzerland's electricity system is in the midst of the greatest upheaval in its successful history.

Who owns the Swiss transmission grid?

41 cross-border lines 2.5 billion Swiss francs of planned investment Swissgrid is the owner of the Swiss transmission grid. Its grid is more than 6,700 kilometres long and transports electricity at a voltage of 380, 220 and 150 kilovolts.

Can Swissgrid be used in grid planning?

In grid planning, Swissgrid can only take into account the potential for flexibility offered by artificial intelligence, decentralised consumption control and smart peak shaving in photovoltaic and wind production if it can be activated and used by Swissgrid at any time.

What is Swissgrid & how does it work?

Swissgrid was established in January 2005 by Switzerland's main electricity grid companies as part of the liberalisation of the electricity market. From 15 December 2006 Swissgrid coordinated Switzerland's transmission grid (380/220 kV), comprised up to that point of eight control areas.

How many kilovolts does Swissgrid have?

Its grid is more than 6,700 kilometres long and transports electrical energy at a voltage of 380 and 220 kilovolts. The transmission grid comprises all the lines as well as 147 substations. Swissgrid carries out regular maintenance, upgrades and appropriate expansions to ensure that the grid is always available.

The Swiss coordinate system (or Swiss grid) is a geographic coordinate system used in Switzerland and Liechtenstein for maps and surveying by the Swiss Federal Office of Topography (SFTO). A first coordinate system was introduced in 1903 under the name LV03 (Landesvermessung 1903, German for "land survey 1903"), based on the Mercator projection and the Bessel ellipsoid.

TSO report on balancing. The annual TSO report on balancing in Switzerland is prepared according to Article 60 of Commission Regulation (EU) 2017/2195 establishing a guideline on electricity balancing, referred to in short as 'energy balancing guideline' (EB GL).

The following article outlines four potential pathways that could enable Switzerland to meet its increasing power-supply needs by focusing on the role of the electric grid, factoring in the economic and regulatory feasibility and ...

Switzerland is increasingly excluded from important EU market mechanisms. This results in a greater risk of more unplanned electricity flows, a lack of consideration in security-relevant system processes and a reduction in import capacities. Grid operators face challenges not only due to the changes in the energy system, but also on account of

transition from "grid-following" to "grid-supporting" PV systems, and solar power shares of ten, possibly twenty percent can be integrated into the grid (Figure 1). However, the time gained is short. Because 50 GW of PV systems cannot be efficiently connected to the power grid in Switzerland with correct over-frequency behaviour only.

Various authors, government organization bodies have given numerous definitions of smart grid. A smart grid can be defined as an upgraded electricity grid network enabling two-way information and power exchange between suppliers and consumers, due to the pervasive incorporation of intelligent communication monitoring and management systems [1].The initial ...

The electricity sector in Switzerland relies mainly on hydroelectricity, since the Alps cover almost two-thirds of the country's land mass, providing many large mountain lakes and artificial reservoirs suited for hydro power. In addition, the water masses drained from the Swiss Alps are intensively used by run-of-the-river hydroelectricity (ROR). With 9,052 kWh per person in 2008, the ...
