What are floating storage regasification units (FSRUs)?

What are FSRUs? Floating Storage Regasification Units (FSRUs) are critical assets in the LNG (Liquefied natural gas) supply chain, delivering reliable gas to onshore infrastructure.

What is floating regasification?

Floating regasification is increasingly being used to meet natural gas demand in smaller markets, or as a temporary solution until onshore regasification facilities are built. Floating regasification involves the use of a specialized vessel often referred to as an FSRU, which is capable of transporting, storing, and regasifying LNG onboard.

How many FSRU vessels are there?

This completes the list of the current 24 FSRU vessels in operation. In addition to FSRUs, there are four floating storage units (FSUs) currently in operation as listed in Table 3.4. FSUs provide an alternative to onshore LNG storage tanks. They are converted LNG tankers but without the onboard regasification facilities installed on FSRUs.

Which FSRU projects are based on LNG?

Gas to power is a key market for LNG and the majority of the current FSRU projects and prospects are linked to smaller onshore power plants typically in the range of 100-500 MW. As an example the current Jamaica terminal feeds LNG to a 120 MW plant⁷⁷ and a proposed new 190 MW plant. The Maltese terminal feeds LNG a 200 MW power plant⁷⁸.

What is a FSRU tanker?

Most FSRUs are classified as ships to provide the flexibility to operate either as an FSRU or LNG tanker. The hull and storage of an FSRU is identical to that of a normal LNG tanker. The vessels are constructed using a double steel hull for integrity and employ either membrane or spherical (Moss) type tanks.

Can a floating storage unit be added to A FSRU?

If more storage is required this weakness could be mitigated by adding a floating storage unit (FSU). If both more storage and more regas capacity is needed this could be provided by replacing the FSRU with a larger unit e.g. Dubai Explorer⁶⁶ or by adding a second or even third FSRU.

Tokelau floating storage regasification unit fsru

the floating storage and regasification units (FSRU) market is expected to grow during the forecast period, due to the increasing governmental support for the use of natural gas as a cleaner energy source, the surging use of FSRUs in remote locations and the ability of FSRUs to provide flexible and reliable LNG supply, cost competitiveness of FSRU"s coupled with growing offshore gas ...

(GBS), and Floating Storage and Regasification Units (FSRU). The design selection depends on site conditions (e.g. water depth, subsea soil characteristics, marine conditions) and sendout capacities (Kulish et al., 2005). A GBS is a fixed concrete structure laying on the sea floor, where LNG storage tanks and regasification equipment are placed.
